

Heuristic Evaluation Report

Evaluator: Eduard Nascimento

Date: February 12th, 2024

Product Overview

- Product Name: Boiler Foods
- Product Goal: An online natural food purchasing website
- User Group: College students at Purdue University

Positive Findings

- <Visibility of system status>
 - <All pages are clearly labeled and indicate which page you are on with titles and visual markers on the header.>
 - *Most pages are clearly labeled and the user understands where they are on the website.
 - 3rd page is perhaps the only page that doesn't explicitly say where you are on the website whowhowever not hard to infer where you are since you can see a big add to cart button and the product.
- Heuristic 2
 - Consistency and standards which are part of Nielsins Heuristics can be seen through the website as the navigation bar is always present on the top of the website allowing quick navigation to where you need to go. The Boiler Foods logo is also always present on the top left of the page.
- Heuristic 3
 - The aesthetic and minimal design Nielsins heuristic is also observed as the design is minimal and does not overwhelm the user with information. This more easily allows the user to accomplish what they want with minimal effort as they do not need to hunt down actions or information.

Key Issues Identified (1)

Issue

- Page: 4
- Heuristic: Consistency and standards
- Description: Page 4 displays a page where the user can leave a review. However where is that on the websites navigation top bar? I assume that might be what contact us entails but then there is a bit of a mismatch.

Recommendation

- Fix should be just matching the navigation bar to pages being shown with simple but accurate descriptions.
- Here is an example: Review Us!

Write a review:

User create and Post 4 / 5

A Web Page

https://boilerfoods.com

Boiler Foods

Home About Us Products Contact Us search

Write a review:

Food Item

Description

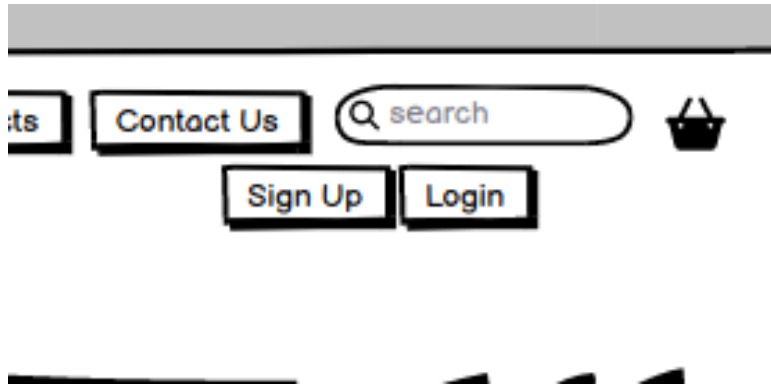

Post Review

This page enables users to generate items and submit them, such as composing a review for a product they have purchased.

Key Issues Identified (2)

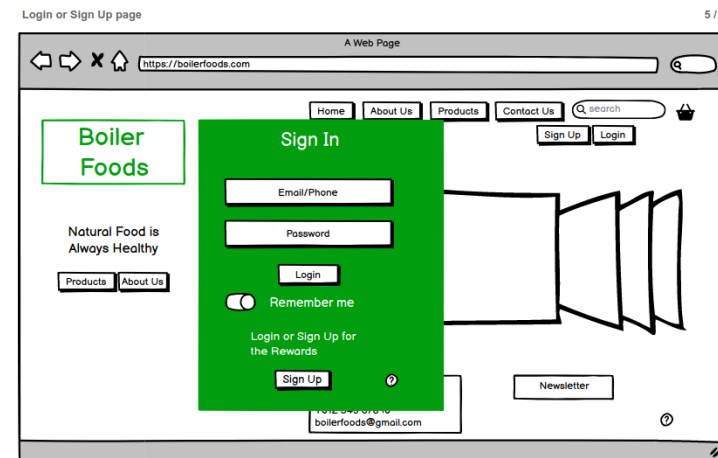

Issue

- Page: 5
- Heuristic: Consistency and Standards
- Description: In page 5 there is a login and sign up navigation icon that is not available in the other pages of the site

Recommendation

- Make sure all the pages are consistent and include the login and sign up button. Maybe they can be under a single button? How does amazon do this for example? Maybe the user could be requested or at least suggested to log in right at the home page for ease of use and product recommendations? The placement perhaps could be improved. Page 1 also has 2 sign up buttons.

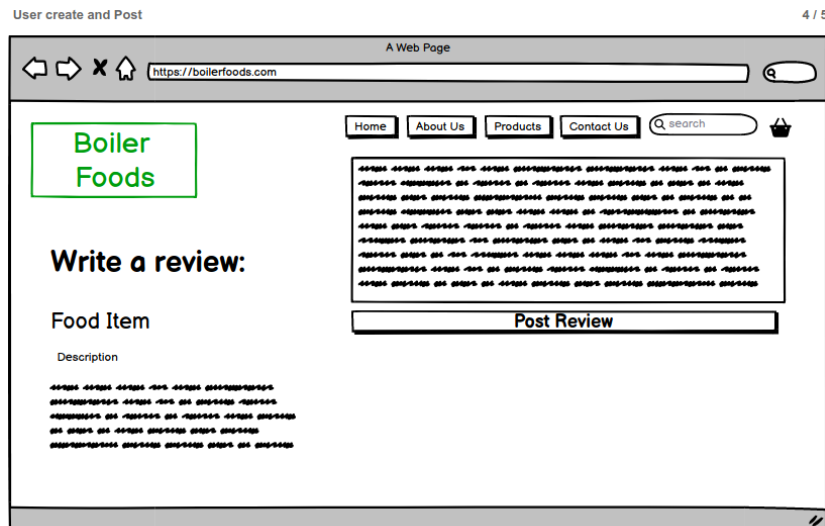

Key Issues Identified (3)

Issue

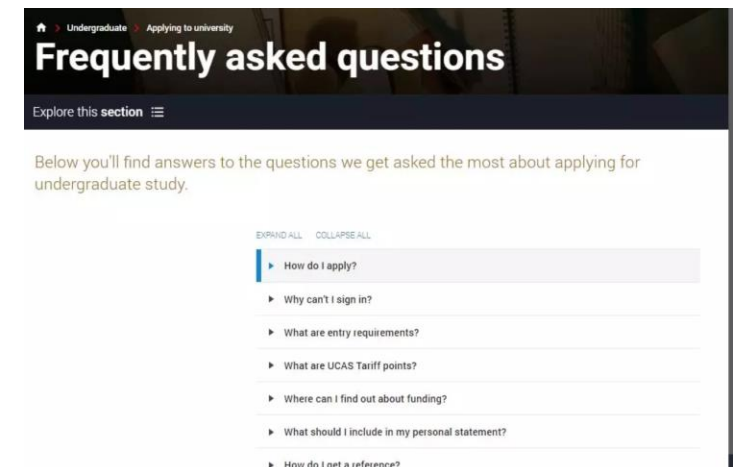

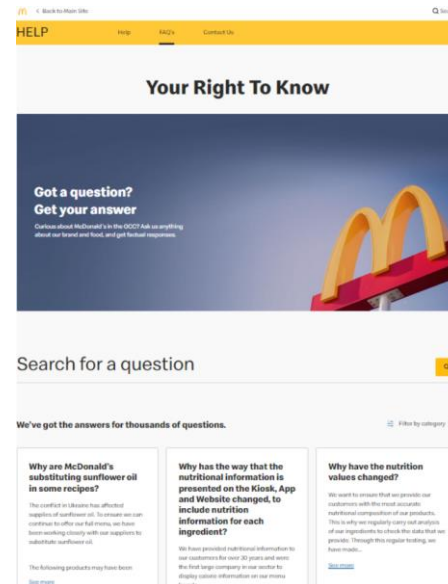

- Page: 4
- Heuristic: Help and Documentation
- Description: There is no functionality visible on the site for the customer to request help, refund for and order, look at an FAQ thread, or perhaps ask questions to a representative over text chat.

Recommendation

- Perhaps there could be something that is similar to how uber does it? They have a live chat for customer support with a chatbot that asks questions to help you troubleshoot your issue. Or how amazon does it with posts that can be answered by the seller with replies. Perhaps a help section of the site where the user is able to do this and cancel or get refund for orders, help and other tasks of similar nature.
- Examples:

This page enables users to generate items and submit them, such as composing a review for a product they have purchased.

Evaluation for Home Page

- Navigation bar options could be better lined up and formatted.
- There is some negative space on the bottom left of the page perhaps the elemtes could be ligned up to look more symetric or better spaced out in the page. (Howhever I do not know how that could be better accomplished.
- Boiler foods logo could be positioned on the center of the page with picture carousell with other elements centered around it.
- Could be arranged similarly how google.com home page is set up with everything revolving around the logo.

Visibility of system status

- <describe issue>
 - or
 - <describe how well the page shows system status>
-
- On many of the pages the user can see and understand where they are on the webapp. However this could perhaps be made even more obvious in some of the pages by having the explicit title of the page or where the user is displayed in the screen. I would say overall system status visibility is good on the site.

<Heuristic 2>

- The Match between system and real world heuristic could perhaps be better implemented.
- The home page could display a start shopping button to further emphasize this is where the user can start shopping instead of just having the user go to products.
- After adding to cart and being done shopping there could be an option for the user to check out and purchase the items.

Evaluation for Products Page

- Flexibility and efficiency of use heuristic.
- There could be a way for the user to more effectively look at the items In the product page.
- The user could sort by product category, price or perhaps other features to enable faster shopping with more ease.

Evaluation for Add To Cart Page

- Error Prevention heuristic.
- There is not a way for the user to remove the item from their cart if they do not wish to purchase the item anymore.
- There is no way for the user to change the ammount of items purchase if the user decides he does not want that many items anymore.

Evaluation for Write a Review Page

- Help and documentation heuristic.
- As mentioned in the key issues slide before there should be a way for the user to contact the shop for refunds, questions or customer support.
- There could also be an FAQ with questions set up to help users with common questions.

Evaluation for Sign In Page

- User control and freedom heuristic
- The user should be able to close the sign in page or opt to not sign in if they so desire.
- There could be an option for users to pay and order by inputting payment information and not creating an account.
